Co-funded by the Intelligent Energy Europe Programme of the European Union

„Aren't the trolleybuses anyway green enough?“

The city's trolleybuses are indeed powered with clean **hydro-electricity**.

Through the use and application of energy-efficient driving techniques, up to **20% of energy** can be **saved** on top of that! The driver training sessions in spring 2013 proved these findings.

From these extra energy savings, it is possible to supply the equivalent of **159 homes** for an entire year with electricity.
