Co-funded by the Intelligent Energy Europe Programme of the European Union

„Energy-efficient driving extends journey times?“

Energy-efficient driving does NOT mean slow driving, but rather **adjusting one's driving style** to correspond with the specific situation.

Letting the bus simply roll down gradients without extra acceleration **decreases energy consumption**, while **not noticeably impacting** the journey time.

Especially during off-peak hours with little other traffic on the roads, it is possible to let the bus roll more often and **accelerate far less**, allowing **more energy savings without slowing down** the journey!
